Chaapel's Clover Lawn Grass Seed

Recleaned and tested seed, weighing 30 pounds to the bushel

Our mixture absolutely can be relied on as being made up of the finest quality of grass seed obtainable, free from weed seeds, chaff or fallow and of the very best and highest germinating qualities. It is a special mixture of grasses that do best in our soils. The increasing demand for a lawn seed having a larger proportion of White Clover induced us to offer this mixture which contains a most liberal quantity of best recleaned White Clover. While primarily made up for normal locations, it contains certain grasses that will thrive on partially shady places. Sow 1 quart to 200 square feet (10 x 20 ft.). Pt. 25cts., qt. 40 cts. (postpaid 50 cts.), 2 qts. 75 cts., 4 qts. \$1.40, pk. \$2.25, bus. (30 lbs.) \$8.00. Postage extra.

Chaapel's Shadygreen Lawn Seed

While it is impossible to maintain a permanent lawn in certain shady locations, such as under soft maple trees, we have combined in this mixture certain grasses that are more resistant to these harsh conditions. We recommend this mixture to be especially prepared for shady locations. Sow 1 quart to 100 square feet (10 x 10 ft.). Qt. 55 cts., 2 qts. \$1.00, 4 qts. \$1.90, pk. \$3.50, bus. \$12.00.

FERTILIZERS MAKE FLOWERS GROW AND BLOOM

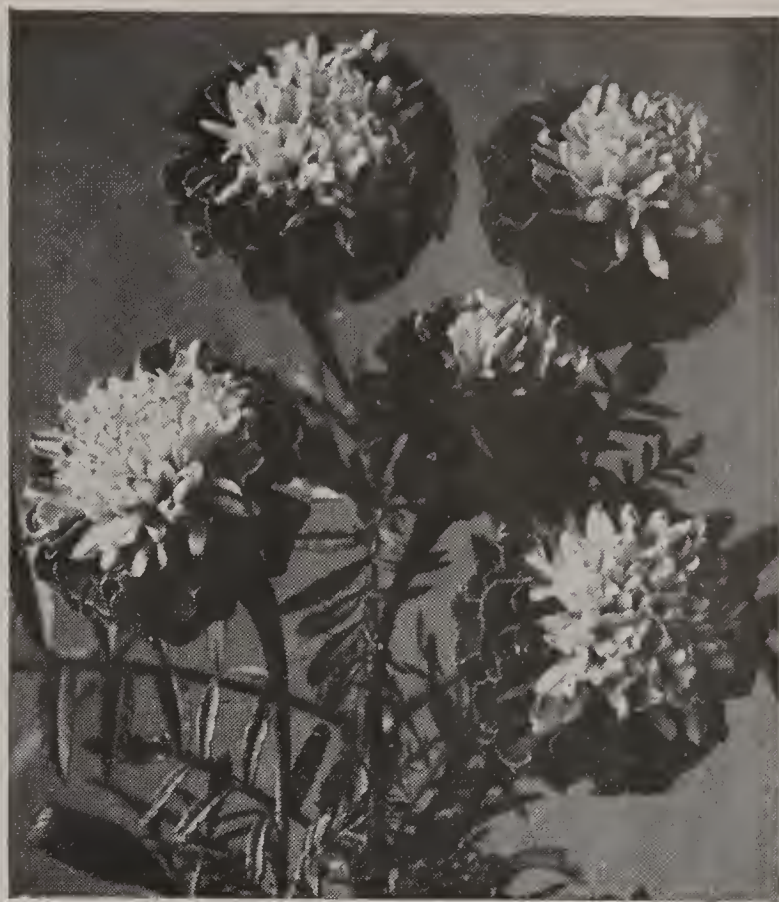

Most annual flowers, due to their short season of growth and profuse bloom, are heavy feeders and require an abundance of a quick-acting fertilizer. Nitrate of Soda and Sheep Manure are particularly adapted for this class of plants. The Sheep Manure should be applied at the time of planting; the Nitrate of Soda several times during the season. The perennial plants are slower growers and for that reason the less active fertilizers, such as Bone-Meal and our Special Garden Fertilizer, meet their requirements. Either should be applied at time of planting and supplementary applications should be made during the life of the plant. For prices see page 41.

Super Snowball

Cauliflower

For many years cauliflower has been considered one of the most delicious vegetables, but until lately it was thought to be hard to grow. However, it is now known that the same methods that produce good cabbage will grow good cauliflower. The only great difference in culture is that cauliflower heads must be protected from sunlight so as to make sure of the desirable white curd. This is most easily accomplished by gathering the tops of the leaves together loosely as soon as the heads begin to form. In shutting off the light, it is important not to cramp the heads.

SUPER SNOWBALL

Carrots

Carrots contain large amounts of those elements which the human body needs for health and strength. They require about the same simple care as beets, they have no serious insect enemies, and they are rarely attacked by disease. Since freshly manured soil often causes divided roots, it is best to plant them in soil that has been richly fertilized the previous season. Plant the seed one-half inch deep in loose, well prepared soil, making rows 16 to 24 inches apart. Cultivate as soon as the plants are well established and thin to 2 or 4 inches in the row according to the size of the variety. Plantings may be made from early spring until mid-June. For winter storage the later date is advisable.

The superb color, fine quality, crispness and heavy yield all combined will undoubtedly make this the most popular carrot variety on the list as soon as it becomes known. CONTROL OF CORN EARWORM

The ears of sweet corn are attacked by young caterpillars which feed first on the growing silk and later work down into the ear, eating the kernels. Early maturing varieties of plants are less subject to injury from the caterpillars. Sweet corn may be protected by dusting with a combination of lead arsenate and dusting sulphur, using equal parts of the materials. The dust should be applied as soon as silk forms on the developing ears. It may be necessary to make several applications, as the ears do not all develop at the same time.

Whipple's Yellow Sweet Corn

Finest White Sweet Corn

Seeds may be planted either in rows or hills. If planted in rows, they should be spaced from 2½ to 4 feet apart, depending on the height of the variety; seeds should be dropped at the rate of 5 or 6 to the foot, and covered about 2 inches deep. If planting in hills, drop 5 to 6 seeds per hill and space the hills 3 feet apart each way. When plants are 4 to 5 inches tall, thin from 8 to 12 inches apart and keep well hoed until the ears are set.

PEAS

SELECTED FOR OUR CRITICAL TRADE

Our list embraces the newest and highest types in Pea culture.

Peas are different from all other vegetables—the seeds are large and only one stem grows from each seed. They do not tiller; the plant is not bushy. They must be planted close together—12 to 16 seeds to the foot.

While a 10-cent packet of lettuce or radishes might suffice for the family garden and yield sufficient portions for numerous meals, a like amount of Peas will not. It requires 1 pound to plant 40 feet of row. Peas form a profitable crop to grow. Plant all you have room for.

All varieties growing more than 1½ feet high do better if staked up or otherwise supported when 4 to 6 inches tall. This support is usually given by sharpened branches of trees set between the double rows. The crop should be gathered as fast as it is fit to use. Even though just a few pods begin to ripen, new pods will cease to form, and those partly advanced will stop growing.

Radishes

One ounce will sow 100 feet of drill

The ground for growing radishes should be finely prepared and as free as possible of small stones and lumps. Plant seed about $\frac{1}{2}$ inch deep in rows 12 to 18 inches apart, and when up about an inch thin to 1 or 2 inches apart. Radishes are at their best when growth is quick and steady. BROWN SPRAYERS

NO. 4 AND NO. 3 OPEN-HED SPRAYER

This Sprayer is completely electrically welded. The metal at the seams, top and bottom joints are fused together to make a practically seamless "one-piece" tank, which far surpasses the tank of the conventional sprayer in strength and lasting quality.

After the tank is processed it is coated with a heavy coat of hot galvanize inside and out. This fills up every seam, and when it hardens forms a tank lining which has no seams. It also insures against the galvanizing flaking off while being processed.

Pump cylinder is 2" diameter seamless brass, 14" long and screws into Sprayer top so that pump is one complete unit. Pump is quickly and easily locked in two movements; first, a twist of the wrist to lock it in place; second, locking lever is pushed down to compress gasket. Plunger is heavy steel with double rubber grip handle so that both hands may be used to pump up pressure. This locking device is absolutely safe and is the quickest and easiest lock ever introduced.

AUXILIN

The Miracle Root Grower
REAL ROOTS FROM CUTTINGS
Faster-Surer-Cheaper

Auxilin is a hetero-auxin, with Indolebutyric acid its active ingredient—that actually induces roots to grow on cuttings, from plants, shrubs and trees! It grows roots on cuttings that even professional growers find difficult and often impossible to root normally. See actual photograph of American Holly (*Ilex*) roots in 6 weeks. Auxilin treated cuttings develop more roots over wider area of stem tissue and base. (Roses, including hybrids, average 75 roots per cutting in 2-3 weeks!) Faster growth, sturdier roots, healthier plants, more profuse blooming. Less disease. No special tools needed. Complete with graduated phial and full directions.

The Care and Feeding of Birds

The proper care and feeding of birds is simple, and if followed, you will have little difficulty in raising a choice singer. Beware of stale seed or seed having a musty odor. It will upset the entire intestinal tract and often throws your bird out of song for months, besides often causing baldness. Purchase your bird seed where you are sure to have it fresh. Use Fullsong Mixed Bird Seed, it is scientifically mixed to give the bird the variety of clean fresh seeds that is necessary to the health and happiness of canaries.

In order to digest his food properly, the canary should also have access to clean grit and gravel to grind his food, sweeten contents of the stomach, and supply necessary minerals.

Fresh, clean water is very essential to the well being of a canary. The bird should be given clean water in a clean water dish every day.

Many canaries are killed or caused to lose their song by over-feeding on tid-bits such as sweets or pastry, which are

not good for seed-eating birds. While some people advocate the feeding of green stuff to canaries, we have found that more often than not this is injurious as usually the bird is allowed to have too much. Fullsong Mixed Bird Seed is a sufficient and well-balanced diet for canaries, without the use of these often injurious tid-bits.

As treats for canaries we advise some of the foods which we will describe later. These are made from different seeds which make up the canary's normal diet, but give him a little more variety than can be had in a mixed bird seed. Some of these have distinct medicinal properties and are used in treating various ailments to which canaries are subject.

Several times a week a canary should be allowed to bathe in a dish of clean water from which the chill has been removed and to which Antiseptic Wash has been added.

Never permit him to hang in the kitchen, as the steam from the cooking will cause him to take cold, and his song will stop indefinitely. Do not place the cage close to the cold, frosty window for he will become chilled and this checks his singing for a time. Hang it at one side of the window so that he does not come in direct contact with the glass. Your bird will stand considerable cold if there is no draught, but he cannot stand much heat or smoke; it quickly overcomes him.

IMPORTANT—The Ideal Diet for all Canaries: One seed dish full of FULLSONG BIRD SEED, one tonic dish full of Fullsong Health Food, and fifteen drops of Fullsong Bird Bitters in a water cup full of clean water each day. This diet with Fullsong Gravel on the cage floor comprises the daily care we give our own birds and we have a minimum amount of sickness, with a maximum amount of song. When followed strictly the above treatment is inexpensive and requires a minimum amount of time and labor.
